Datasea held a 5G digital industry platform-rural revitalization project discussion meeting

On September 3, Datasea held a project discussion meeting with the theme of "5G Digital Industry Platform - Rural Revitalization" in Beijing. The meeting invited well-known universities including Chinese Academy of Social Sciences, Tsinghua University, Beijing Academy of Agriculture and Forestry, and North China University of Technology. More than 30 people from research institutions and enterprises, including experts and scholars in various fields such as agriculture, economy, industry, education, investment and construction, as well as representatives of key demonstration projects of digital villages, attended the meeting.

Liu Fu, Chairman of Shuhai Beijing, and the management team in Datasea hosted the meeting. The rural revitalization strategy is an initiative in China with an aim to promote the sustainable development of the countryside, including creating a robust rural economy. Experts conducted in-depth discussions on digital villages, the development strategy of the 5G communication industry of Datasea, and the revitalization and development of digital villages empowered by 5G messaging.

Against the backdrop of China's push to advance rural revitalization, which incorporates the implementation of many policies and national aims, Datasea believes leveraging 5G messaging to serve the communication and marketing needs in the rural area, can help transform the lives of its rural residents. Relying on technical advantages, Datasea has built a 5G digital industry platform, with the access opened for 2,800 villages across the country, these villages can tap into their digital construction needs. The marketing facet of 5G messaging will also boost the local economy and commercial activities and will in return diversify Datasea's revenue streams.
